

Single Maintenance and Reliever Therapy (SMART)

For safety, GINA (Global Initiative for Asthma) no longer recommends treatment of asthma with a short-acting beta-2 agonist (SABA) alone. All asthma treatment regimens should include an ICS (inhaled corticosteroid)- containing controller treatment.

SMART Therapy

- Medication regimen that consists of ICS-formoterol inhaler for daily maintenance treatment and taking additional doses for as needed symptom relief.
 - In mild asthma, treatment with as-needed-only low dose ICS-formoterol reduces the risk of severe exacerbations by about two-thirds versus a SABA alone.
 - Formoterol is a rapid, long-acting beta-2 agonist (LABA) and can be used as a reliever medication in place of a SABA.
 - Currently, the combination of ICS-formoterol is available in two agents, budesonide/formoterol (Symbicort) and mometasone/formoterol (Dulera), with budesonide/formoterol being recommended as first-treatment by the asthma guidelines.
- Patients prescribed ICS-non-formoterol maintenance medication should continue to use SABA as their reliever medication.

ND Medicaid accommodates SMART therapy by allowing 2 Symbicort or Dulera inhalers per 30- day supply not to exceed a total of 9 inhalers per 182 days without prior approval.
